Medical Waste

- Medical waste is any kind of waste that contains infectious material (or material that's potentially infectious).
- This definition includes waste generated by healthcare facilities like physician's offices, hospitals, dental practices, laboratories, medical research facilities, and veterinary clinics.

01 INFECTIOUS WASTE

- Anything that is soaked in blood (gloves, gauze, gowns etc.)
- Cultures of infectious diseases or agents
- Any waste produced in patient's rooms with communicable diseases

Dispose in yellow color bag labeled with the universal "Biohazard" symbol

This kind of waste includes anything that can pierce the skin, including needles, scalpels, lancets, broken glass, razors, ampules and staples

Dispose in sharp container labeled with the universal "Biohazard symbol"

TYPE OF MEDICAL WASTE

03

Pharmaceutical Waste

This grouping includes all unused , expired, and/or contaminated vaccines and drugs. It also encompasses antibiotics, injectables, and pills.

Dispose in brown color box labeled with pharmaceutical waste

Dispose in purple bag labeled with the universal “Cytotoxic” symbol

Cytotoxic Waste

This is a highly hazardous form of medical waste that’s either carcinogenic, teratogenic, or mutagenic. It can include cytotoxic drugs intended for use in cancer treatment.

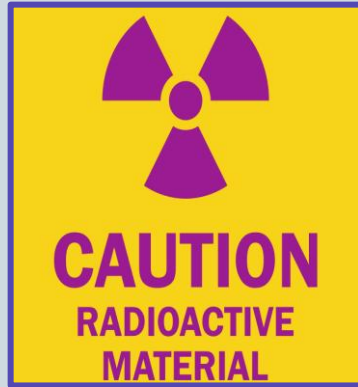

04

TYPE OF MEDICAL WASTE

05

Radioactive Waste

There are many types of radioactive medical waste, but basically anything that comes into contact with trace amounts of certain isotopes, or a stronger radiation source (such as medical equipment, packaging materials, washing fluids, paper wipes, or even clothing) can be considered as such.

Dispose in lead box
labeled with the
universal “radioactive
symbol”

Dispose in red bag labeled
with the universal
“Biohazard symbol”

Pathological Waste

Human fluids, tissue, blood, body parts, bodily fluids, and contaminated animal carcasses come under this waste category
